  // Necessary for Fire OAuth to Function
  const fireBroadcastingChannel = new
BroadcastChannel('fireOAuthChannel');
  fireBroadcastingChannel.addEventListener('message',
async event => {

    let data = event.data

```

```
/**
 * @typedef {Object<string, any>} Data
 * @property {boolean} success - Whether the login was
successful
 * @property {string} token - The data returned from the
login i.e. Fire Token
 */
```

```
// data.token is the message sent from the
fireOAuthChannel after verification
// data.success is a boolean that indicates whether the
verification was successful
// data.token is the fire token
```

```
// What to do with the Fire Token?
// * Fire Token is an unique token which uniquely
identifies the user who authorized your login attempt with Fire
// * You can use this token ONLY ONCE as it will be
destroyed after the first use
```

```
// 1. Send the fire token to the Fire Server to verify the
user
// - You can do that client sided or server sided
// - You need to send a POST Request to the Fire Server
with the fire token
// at the URL: http://localhost:3003/api/tokens/verify
// - The Fire Server will verify the fire token and return
a response
// - If the verification was successful - CODE (200), the
Fire Server will return a response with the user's data
// - If the verification was unsuccessful - CODE (400) or
CODE (401), the Fire Server will return a response with an error
'message'
```

// - You can use the data returned from the Fire Server to create a new user in your database

```
// This example will send the token to Fire Servers and
console.log the response
    console.log("%c" + `Fire Token: ${data.token}`, `color:
    #f1c40f; font-weight: bold;`);
    const response = await
